
Personalized email. Powered by PowerShell.

The right language. The right document. Every employee.

Use Case

Microsoft Word Mail Merge

Sending personalised emails with individual attachments, a different invoice, report, or document for each recipient, **isn't possible** with classic Word mail merge. Word can attach a single file to every message, but it has no way to send different files to different people.

PowerShell connects everyday tools

PowerShell

Coordinates data, templates, files and email delivery

Outlook / email

Create HTML emails with attachments, unique to each employee

Excel

Read employee data, language and filenames

PDF documents

Locate the unique statement to attach

Network files

Retrieve templates and supporting files

THE PROBLEM

Each employee needs a custom email

01**Language**

Use the employee's
chosen language

02**Personal document**

Attach the relevant
document to the email

03**Supplemental detail**

Include extra PDFs or
instructions, when needed

The challenge: get every combination right without manual assembly

One Excel row drives each employee email

Illustrative data — maintain in Excel; export to CSV for a simple PowerShell input.

Email	Language	Personal PDF	Extra attachment(s)
alex@example.com	EN	Tax_1001.pdf	Guide_EN.pdf
sam@example.com	FR	Tax_1002.pdf	Guide_FR.pdf; FAQ_FR.pdf
lee@example.com	EN	Tax_1003.pdf	—

THE SOLUTION

Read. Match. Validate. Send.

1**Read the list**

Load one employee record at a time.

2**Build the email**

Select the right email template (in HTML).

3**Attach files**

Attach the required files to each email.

4**Send and log**

Use Microsoft Graph; record send status.

Go beyond standard email Mail Merge

Capability	Standard <u>Word</u> Mail Merge	<u>PowerShell</u> solution
User friendly	Yes	No
Personalized email	Yes – to a certain extent	Yes – very customizable via HTML templates
Choose a language template	Separate merges and/or conditional text (harder to configure & manage)	Simple to pick a combination of email template + attachments, by person
Unique and/or additional attachments	Not possible – everyone gets the same document or none	Any combination is OK
Pre-send checks and logging	None aside from reviewing drafted emails (outlook set 'offline')	Can create log files, exception tracking etc.

PowerShell can handle sending unique emails, with specific attachments and handle customization with ease.

THE CAPABILITY

Use Case
